IN THE ABSTRACT:

        Please delete prior Abstract and insert the following Abstract starting at page 35, line 2 and ending at line 15.

        --An information processing apparatus, in which a printer driver is installed for transmitting a print job to be printed to a printer, includes a display for displaying a printer setting window activated by the printer driver, a print medium designator for designating a print medium from the printer setting window, a mirror image print designator for designating a mirror image print via the printer setting window on which it can be designated whether the mirror image print is performed or not when a transparent medium has been designated by the print medium designation means, and a print job command setter for setting a paper type designation command. The print job command setter (i) sets a transparent medium designation command in a PDL command of the print job when a transparent medium is designated by the print medium designator and the mirror image print is not selected by the mirror image designation means, and (ii) sets the transparent medium designation command and the mirror image print designation command in the PDL command of the print job when a transparent medium is designated by the print medium designator and the mirror image print is selected by the mirror image designator.--
